It consists of copper conductors and current collectors in the C-PVC body. The uninterrupted energy supply and movement of the system is provided by current collectors connected to the system mechanically.

The eliminates the possibilities such as accident, malfunction in energy distribution with suspended and reel cable in conventional systems. Conductors are enclosed in C-PVC housing and personnel safety is maximized.

There is no fixed connection between the conductor housings and the conductors and between the C-PVC housing and the sliding hangers, the necessary expansion opportunity is provided, therefore the expansion element is unrequired.

Cautions:
If it is used in external environments exposed to rain, it is recommended to protect it with a cover such as a canopy.

Current collector with clips allow the customers to perform cabling as they desire with the clips they include.

Current collector are the moving elements of the trolley busbar systems. Current collector brushes rub against the conductors and draw continuous current while they move through the busbar line. They adapt to shaky and vibrant conditions thanks to the moving brushes. As current collecting and transfer systems are included in the C-PVC housing, they are protected against human contact.

▶▶ VOLTAGE DROP

The voltage drop in the busbar lines shall be inspected as per the busbar type selected according to the total current calculated based on the ambient temperature and operating period of the system. Maximum acceptable value for voltage drop is 3%.

For Direct Current	$\Delta U = 2.L_t.I_G.R$	ΔU =	Voltage Drop [V]
		I_G =	Total current [A]
For Mono-Phase Alternative Current	$\Delta U = 2.L_t.I_G.Z$	R =	Resistance of the busbar [Ω/m]
		Z =	Impedance of the busbar [Ω/m]
For Three-Phase Alternative Current	$\Delta U = \sqrt{3}.L_t.I_G.Z$	L_t =	Calculated Hole Length [m]

Note : Calculation of the current drawn during first start in various motor types;

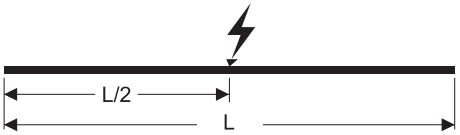
I_A= Total current drawn in the first start of the motors [A]

For the starting current;	Three-phase asynchronous drive in direct start	$I_A = I_G$ x calculated as 5 to 6
	Slip ring rotor motor	$I_A = I_G$ x calculated as 2 to 3
	Frequency converter	$I_A = I_G$ x 1,20 to1,50 calculated between.

▶▶ CALCULATION OF FEEDING POINTS

When we take L_t as the length of the line, feeding points may be selected as shown in the diagrams below to keep the L voltage drop at minimum and it may be used as the hole length for the calculation of L_t voltage drop.

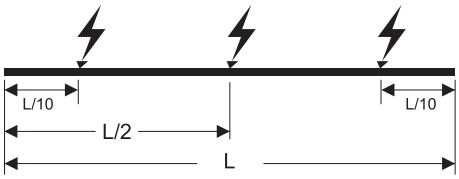
1 feeding point from the start, Lt=L



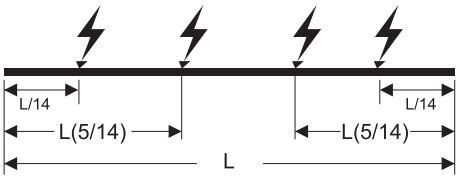
1 feeding point from the center, Lt=L/2

2 feeding points from the start points, Lt=L/4

2 feeding points, Lt=L/6



3 feeding points, Lt=L/10



4 feeding points, Lt=L/14
